

Workout Injury Risk Report

2026-08-30 22:22

Health Summary

BMI 18.8 (Normal) - Goal: Bulk

Great job crushing your workout today; sitting at a BMI of 18.8 gives you a fantastic, lean baseline to build quality muscle during your bulk. Since you are powering your growth on an ovo-vegetarian diet, aim for a consistent caloric surplus and leverage protein-dense options like eggs, dairy, and legumes to support muscle synthesis. Pair this nutrition with progressive resistance training and ample rest, and you will set yourself up for steady, healthy gains.

Workout Summary

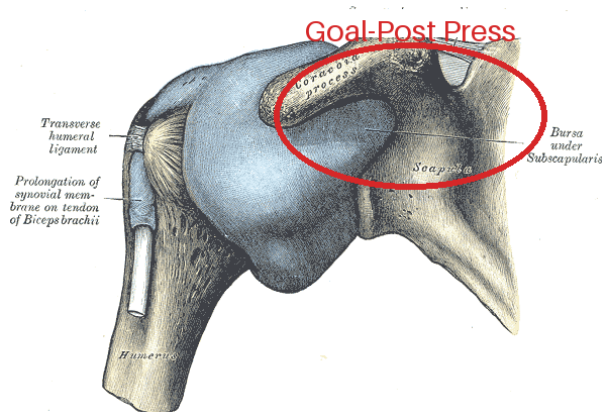

Duration: 06:31

Exercises Completed

- Hammer Curls: 10 reps
- Shoulder Press: 10 reps
- Bicep Curls: 10 reps
- Lateral Raises: 9 reps

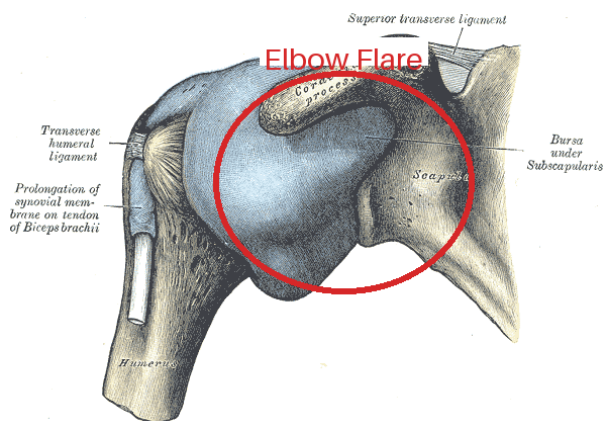

Mishaps & Injury Risk

Goal-Post Press

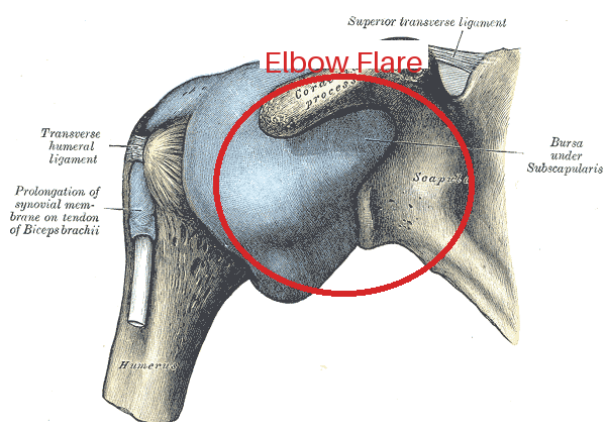

During your press set, your elbows flared up and out to the sides well before your arms fully extended, making the movement resemble a lateral raise rather than a vertical press. This places your shoulder in a wide, unsupported position for much of the movement instead of driving the weight along a controlled path. Over time, loading the joint in this wide position increases your risk of shoulder impingement.

Elbow Flare

During your bicep curls, your elbows drifted away from your torso as you lifted the weight. This flaring motion shifts the load onto the front of your shoulder joint rather than keeping the focus on isolating your arm. If uncorrected over many repetitions, this pattern is associated with anterior shoulder strain.

Elbow Flare

During your hammer curls, your elbows drifted away from your sides during the movement. Allowing your elbows to flare outward takes the work away from isolating your arm and redirects stress onto the front of your shoulder joint. Continuing to curl with this form over time can lead to anterior shoulder strain.
